

The way this code is constructed is meant to test out how to use server with public folders like index, script, and style. By doing this I build code inside of the server that has GET, POST, PUT and DELETE which communicates with the public files that let me decorate and construct the website into whatever I want. I did this by allowing the user to add or unadd any words they please into an item object that gets displayed. The way the code is meant to work is you put whatever word you want displayed into the white box, and then once you click the button it will be pushed to output the word that got entered. After that, you will see the word is now underneath the title "History List" which now the client can decide to either keep the word displayed, delete it or keep adding more words to the list.

AI prompts:

Can you give me examples of how a universal GET, POST, PUT and DELETE javascript code would look like?

Can you give me an outline of what my script file with bulleted pointed of what kind of code is needed

Can you explain to me what app.get does

Can you help with detailing the index.html and style.css?

Why is one button in html and another needing to be css?

```
C:\Users\Sasha\cit281\p6>node p6-server
Server running on http://localhost: 3000
Item added: { id: 1, name: 'yes' }
Item added: { id: 2, name: 'no' }
Item added: { id: 1, name: 'dog' }
Item added: { id: 2, name: 'bird' }
Item added: { id: 3, name: 'lizard' }
Item added: { id: 4, name: 'shark' }
Item added: { id: 5, name: 'frog' }
```
